

Wasla — Phase 1 Design Document

Date: 2026-06-23

Author: Redstar

Status: Approved ✓

1. App Concept

Wasla (وصلة) — "Connection" in Arabic.

A local service marketplace connecting clients with verified professional service providers (prestataires) in Algeria, with expansion to Morocco planned.

Wasla is a "mise en relation" platform — not a job board, not a trade directory. It connects people who need a service with professionals who provide it, entirely within the app.

The Problem

- No verified reviews exist for tradespeople in Algeria
- Prices are opaque — no transparency
- Hard to find available, competent professionals quickly
- Current channels: Facebook groups, WhatsApp, word of mouth (bouche-à-oreille)

The Opportunity

Nothing structured exists in Algeria. Ouedkniss, Yassir, and Leboncoin were referenced as comparable platforms (local context).

2. Brainstorm Q&A — All Decisions Recorded

Q1: New repo or existing repo?

Answer: Brand new GitHub repository — clean start, separate from the existing Mawaqit project.

Repo name: `wasla`

Q2: App name?

Options presented:

Name	Meaning
Khidma	"Service/Job" in Arabic — ❌ rejected: causes confusion with job platforms
Hirfa	"Trade/Craft" — ❌ rejected: too specific to manual trades
Ustal	"Master craftsman" — considered
ArtiDZ	Artisan + Algeria — ❌ rejected: "artisan" too narrow (un boulanger est un artisan)
MonArtisan	"My Artisan" (French) — considered
Wasla	"Connection/Link" (وصلة) — ✅ CHOSEN
Nasseb	"Connect" in Darija — considered
TrouverPro	"Find a Pro" (French) — considered
MonPro	"My Professional" (French) — considered
Maharat	"Skills" (مهارات) — considered

Why Wasla: One word, works in Arabic and French, means exactly what the app does (connecting client ↔ professional), sounds like a modern app name. Names can be changed later — all infrastructure is renameable.

Q3: App language / i18n?

Options presented:

- A) French only
- B) Arabic only
- C) Both from day 1

Answer: French + Arabic + English from day 1.

Setting up `react-i18next` at the start costs ~1-2 hours but saves weeks of refactoring later. Arabic requires RTL layout support.

Default language: Auto-detect from device OS (`navigator.language`). Fallback = **French** if OS language is not in FR/AR/EN.
Users can switch language anytime from the app menu.

Q4: Authentication method?

Options presented:

- A) Email + password only
- B) Phone + SMS OTP only
- C) Both

Answer: Both — email+password AND phone+SMS OTP.

Many Algerians don't use email regularly; phone login is more natural. Supabase supports both natively.

Q5: User roles?

Answer: Three roles, with lazy registration for clients:

Role	Account	Access
Visitor	None required	Browse, search, view profiles
Client	Email or Phone	Contact prestataires, leave reviews
Prestataire	Email or Phone	Create profile, receive messages, reply

Lazy registration pattern: Clients are NOT required to register to browse. Registration is triggered only when they want to contact a prestataire. This reduces friction (Airbnb / LinkedIn pattern).

No admin panel for Phase 1 — manual moderation via Supabase dashboard.

Monetisation for prestataires: Deferred. Will be designed separately once the platform has users. (Freemium / Abonnement Pro / Achat de leads model planned — see original concept notes.)

Q6: Professional verification — how to ensure prestataires are real professionals?

Answer: 3-step profile setup at registration:

1. Basic info (name, phone, wilaya, commune)
2. Trade declaration (categories, years of experience, bio)
3. Proof upload — ONE of: photo of tools/workspace, past job photo, or professional document (registre de commerce, carte d'artisan) — NOT mandatory to block registration

Badge progression:

- **Non vérifié** — default at registration, profile is visible
- **Vérifié ✓** — after admin manually validates the profile
- **Fiable ★** — after real completed jobs through the app (see reviews section)

Q7: Can a prestataire register for multiple trade categories?

Answer: Yes — free multi-selection from the category list for Phase 1. No hardcoded combination rules yet. We observe what people actually combine and add rules later based on real data.

Example of valid combinations (future reference):

Primary	Compatible secondary
Électricien	Caméras/Alarmes, Domotique
Plombier	Climatisation
Informaticien	Réseaux, Caméras/Alarmes
Climaticien	Frigoriste
Peintre	(standalone)
Menuisier	(standalone)

Q8: How does client-prestataire contact work?

Options presented:

- A) In-app messaging (like Leboncoin)
- B) Structured contact form / request
- C) Phone number revealed after login

Answer: Option A — in-app messaging.

All communication stays inside Wasla. Benefits: platform control, moderation capability, phone numbers stay private, future monetisation lever (gate messaging behind paid plan).

Q9: Location granularity?

Options presented:

- A) Wilaya only
- B) Wilaya + commune
- C) GPS geolocation

Answer: Wilaya + Commune for Phase 1.

Algerian wilayas are very large (e.g., Tamanrasset, Adrar) — commune-level precision is genuinely useful. Referenced: Ouedkniss uses wilaya + commune.
GPS geolocation deferred to a later phase (referenced: Yassir model).

3. Architecture

Option A — React + Vite + Supabase + Vercel CHOSEN

Why Option A: Supabase handles auth, DB, storage AND realtime messaging in one place — no separate backend to build. Vercel deploys automatically on every push. React+Vite already

familiar from Mawaqit project.

Mobile strategy: Since this is a React web app, it already works in mobile and desktop browsers. In Phase 4, Capacitor wraps the same codebase into an Android APK → Google Play Store. One codebase → web + mobile.

Option B — Next.js + Supabase + Vercel (not chosen)

Same backend but with server-side rendering for better SEO. More complex than React+Vite, overkill for Phase 1 validation. Can migrate in Phase 3 if SEO becomes a priority.

Option C — React + Firebase + Vercel (not chosen)

Firebase instead of Supabase. Rejected because Supabase is already connected and configured, and Firebase is more expensive at scale.

4. Phase 1 Feature Set

Feature	Details
Auth	Email+password + Phone OTP, role selection at signup
Language	FR/AR/EN, auto-detect from OS, switchable anytime, default = French
Browse	Home with category grid + search bar, no login needed
Search	Filter by category + wilaya + commune
Prestataire profile	Bio, categories, portfolio photos, badge, reviews
Client registration	Lazy — only triggered when contacting someone
Messaging	In-app realtime, profanity filter, report button
Reviews	Only after job marked complete, optional job photos
Badges	Non vérifié → Vérifié → Fiable
Moderation	Auto profanity filter + manual reports + strike system

Feature	Details
Responsive design	Mobile-first, works on desktop (future website reuse)

5. Pages & Navigation

PUBLIC (no account needed)	
└─ /	Home – search bar + category grid
└─ /search	Results – filtered by category + wilaya + commune
└─ /prestataire/:id	Profile page – portfolio, reviews, contact button
└─ /login	Login page (email or phone)
└─ /register	Registration – choose role (client prestataire)
CLIENT (logged in)	
└─ /messages	Inbox – all conversations
└─ /messages/:id	Single conversation with a prestataire
└─ /mon-compte	Profile settings
PRESTATAIRE (logged in)	
└─ /dashboard	Received requests + messages overview
└─ /messages/:id	Single conversation with a client
└─ /mon-profil	Edit profile, portfolio, categories
└─ /mon-compte	Account settings

Total: 5 public pages + 7 authenticated pages = **12 pages for Phase 1**

6. Data Model

-- Core user account (both clients and prestataires)	
users	
id, email, phone, role (client prestataire)	
preferred_language (fr ar en)	
wilaya, commune	
strike_count	
created_at	
-- Prestataire extended profile	
prestataire_profiles	
user_id, display_name, bio, avatar_url	
categories[]	-- free multi-select
wilaya, commune	
years_experience	

```

    badge (unverified | verified | trusted)
    is_visible (bool)
    created_at

-- Portfolio images uploaded by prestataire
portfolio_photos
    id, prestataire_id, photo_url, caption, created_at

-- Messaging
conversations
    id, client_id, prestataire_id, created_at

messages
    id, conversation_id
    sender_id, receiver_id
    content, created_at
    read_at
    is_flagged (bool)

-- Reviews
reviews
    id, client_id, prestataire_id
    rating (1-5), comment
    job_photos[]          -- optional, uploaded by client
    job_marked_complete (bool)
    created_at

-- Moderation
reports
    id, reporter_id, reported_user_id
    conversation_id, message_id
    reason (profanity | harassment | inappropriate)
    created_at, reviewed (bool)

user_warnings
    id, user_id, reason
    strike_number (1 | 2 | 3)
    created_at

```

Business rule: A client can only submit a review if `job_marked_complete = true` on that conversation. This prevents fake reviews from people who never actually used the service.

7. Moderation System

Automated layer

- Profanity filter runs on every message before it is saved (French + Arabic word list)
- Blocked messages are not sent — sender receives a warning notice

- Repeated violations escalate the strike count

Manual layer

- Any user can tap "Signaler" on any message or conversation
- Reports are stored in the `reports` table
- Reviewed manually via Supabase dashboard (Phase 1), admin panel (Phase 2+)

Strike system

Strike	Action
1st	Warning notification sent to user
2nd	Account temporarily suspended
3rd	Account permanently banned

8. Trade Categories (Phase 1)

- 1. Plombier
- 2. Électricien
- 3. Climaticien
- 4. Frigoriste
- 5. Peintre
- 6. Menuisier
- 7. Informaticien

To be expanded based on market demand.

9. Roadmap

Phase	Focus	Key features
Phase 1	Core MVP	Auth, profiles, search (wilaya+commune), messaging, reviews, badges, moderation, i18n

Phase	Focus	Key features
Phase 2	Engagement	Admin panel, favorites, ratings dashboard, push notifications, profile verification workflow
Phase 3	Scale & Trust	GPS geolocation, commune-level precision, Arabic RTL polish, moderation tools, SEO (Next.js migration?)
Phase 4	Mobile	Capacitor → Android APK → Google Play Store

10. Deferred Decisions

- **Monetisation for prestataires:** Freemium / Abonnement Pro (~500–1500 DZD/month) / Achat de leads — to be designed once the platform has users
- **Trade combination rules:** Which category combinations are allowed — to be defined after observing real registration patterns
- **GPS geolocation:** Deferred to Phase 3+ (Yassir-style)
- **Commission on completed jobs:** Requires payment infrastructure — deferred
- **Admin panel:** Phase 2
- **"Fiable" badge automation:** Exact threshold (how many completed jobs?) — to be defined

11. Infrastructure Connected

Service	Account	Status
GitHub	ClaudeTest	✓ Connected
Supabase	RedOrg / RedProject	✓ Connected (project paused — to restore)
Vercel	Red1's projects	✓ Connected

Note: Supabase RedProject is currently paused and will need to be restored before starting implementation.
